Adverse Childhood Experiences Greater New Brunswick And Middlesex County

What are Adverse Childhood Experiences?

Adverse childhood experiences (ACEs) are potentially traumatic experiences in a person's life occurring before the age of 18 that can have negative, lasting effects on health and well-being.

These experiences include:

- physical abuse
- emotional abuse
- sexual abuse
- neglect

Neglect also occurs when a parent or caregiver fails to provide proper supervision for a child or adequate food, clothing, shelter, education, or medical care although financially able or assisted to do so. To learn more

Adverse Childhood Experiences have been linked to:

- Risky health behaviors
- Chronic health conditions
- Low life potential
- Early death

ACEs can have lasting effects on...

Health (obesity, diabetes, depression, suicide attempts, STDs, heart disease, cancer, stroke, COPD, broken bones)

Behaviors (smoking, alcoholism, drug use)

Life Potential (graduation rates, academic achievement, lost time from work)

*This pattern holds for the 40+ outcomes, but the exact risk values vary depending on the outcome.

According to the Centers for Disease Control and Prevention (CDC)

ACEs Are Common!

About 61% of adults surveyed across 25 states reported that they had experienced at least one type of ACE, and nearly 1 in 6 reported they had experienced four or more types of ACEs.

Preventing ACEs could potentially reduce a large number of health conditions.

For example, up to 1.9 million cases of heart disease and 21 million cases of depression could have been potentially avoided by preventing ACEs.

Some children are at greater risk than others.

Women and several racial/ethnic minority groups were at greater risk for having experienced 4 or more types of ACEs.

ACEs are costly.

The economic and social costs to families, communities, and society totals hundreds of billions of dollars each year.
