Alcohol Use and Abuse Resource Guide

Greater New Brunswick and Middlesex County

General Information about Alcohol

Alcohol is a central nervous system depressant, which means that it is a drug that slows down brain activity. It can change your mood, behavior, and self-control. Alcohol can cause problems with memory and thinking clearly and can affect your coordination and physical control. Alcohol also affects other organs in your body such as raising your blood pressure and heart rate.

Alcohol's effects vary from person to person, depending on a variety of factors, including:

- Amount a person drank
- How quickly they drank it
- The amount of food a person eats before drinking
- A person's age, gender, race and/or ethnicity
- A person's physical condition
- Whether or not they have a family history of alcohol problems

Alcohol Use Disorder

About 18 million adult Americans have an alcohol use disorder (AUD), which means their drinking causes distress and harm. AUD can range from mild to severe, depending on the symptoms. Severe AUD is sometimes called alcoholism or alcohol dependence.

Someone is considered having AUD if they answer yes to two or more of the following questions. In the past year, has this person:

- Ended up drinking more or for a longer time than originally planned?
- Wanted to cut down or stop drinking, or tried to, but couldn't?
- Spent a lot of your time drinking or recovering from drinking?
- Felt a strong need to drink?
- Found that drinking - or being sick from drinking - often interfered with family life, job, school, participating in enjoyable activities, or caused trouble with family or friends?

- Been in dangerous situations because of drinking, such as driving drunk or having unsafe sex?
- Kept drinking even though it was making them feel depressed or anxious? Or when it was adding to another health problem?
- Had to drink more and more to feel the effects of the alcohol?
- Had withdrawal symptoms when the alcohol is wearing off (these include, trouble sleeping, shakiness, irritability, anxiety, depression, restlessness, nausea, and sweating)? In severe cases, they could have a fever, seizures, or hallucinations.

People with AUD should speak to their primary care provider about symptoms, treatments, and referrals.
